# DECENTRALATIO

DEFI FOR SLOW-FOOD AND SMALL-SCALE FARMING

Amici Elettronici is an association focused on bringing the power of smart contracts and trustless lending protocols to small-scale and sustainable farmers.

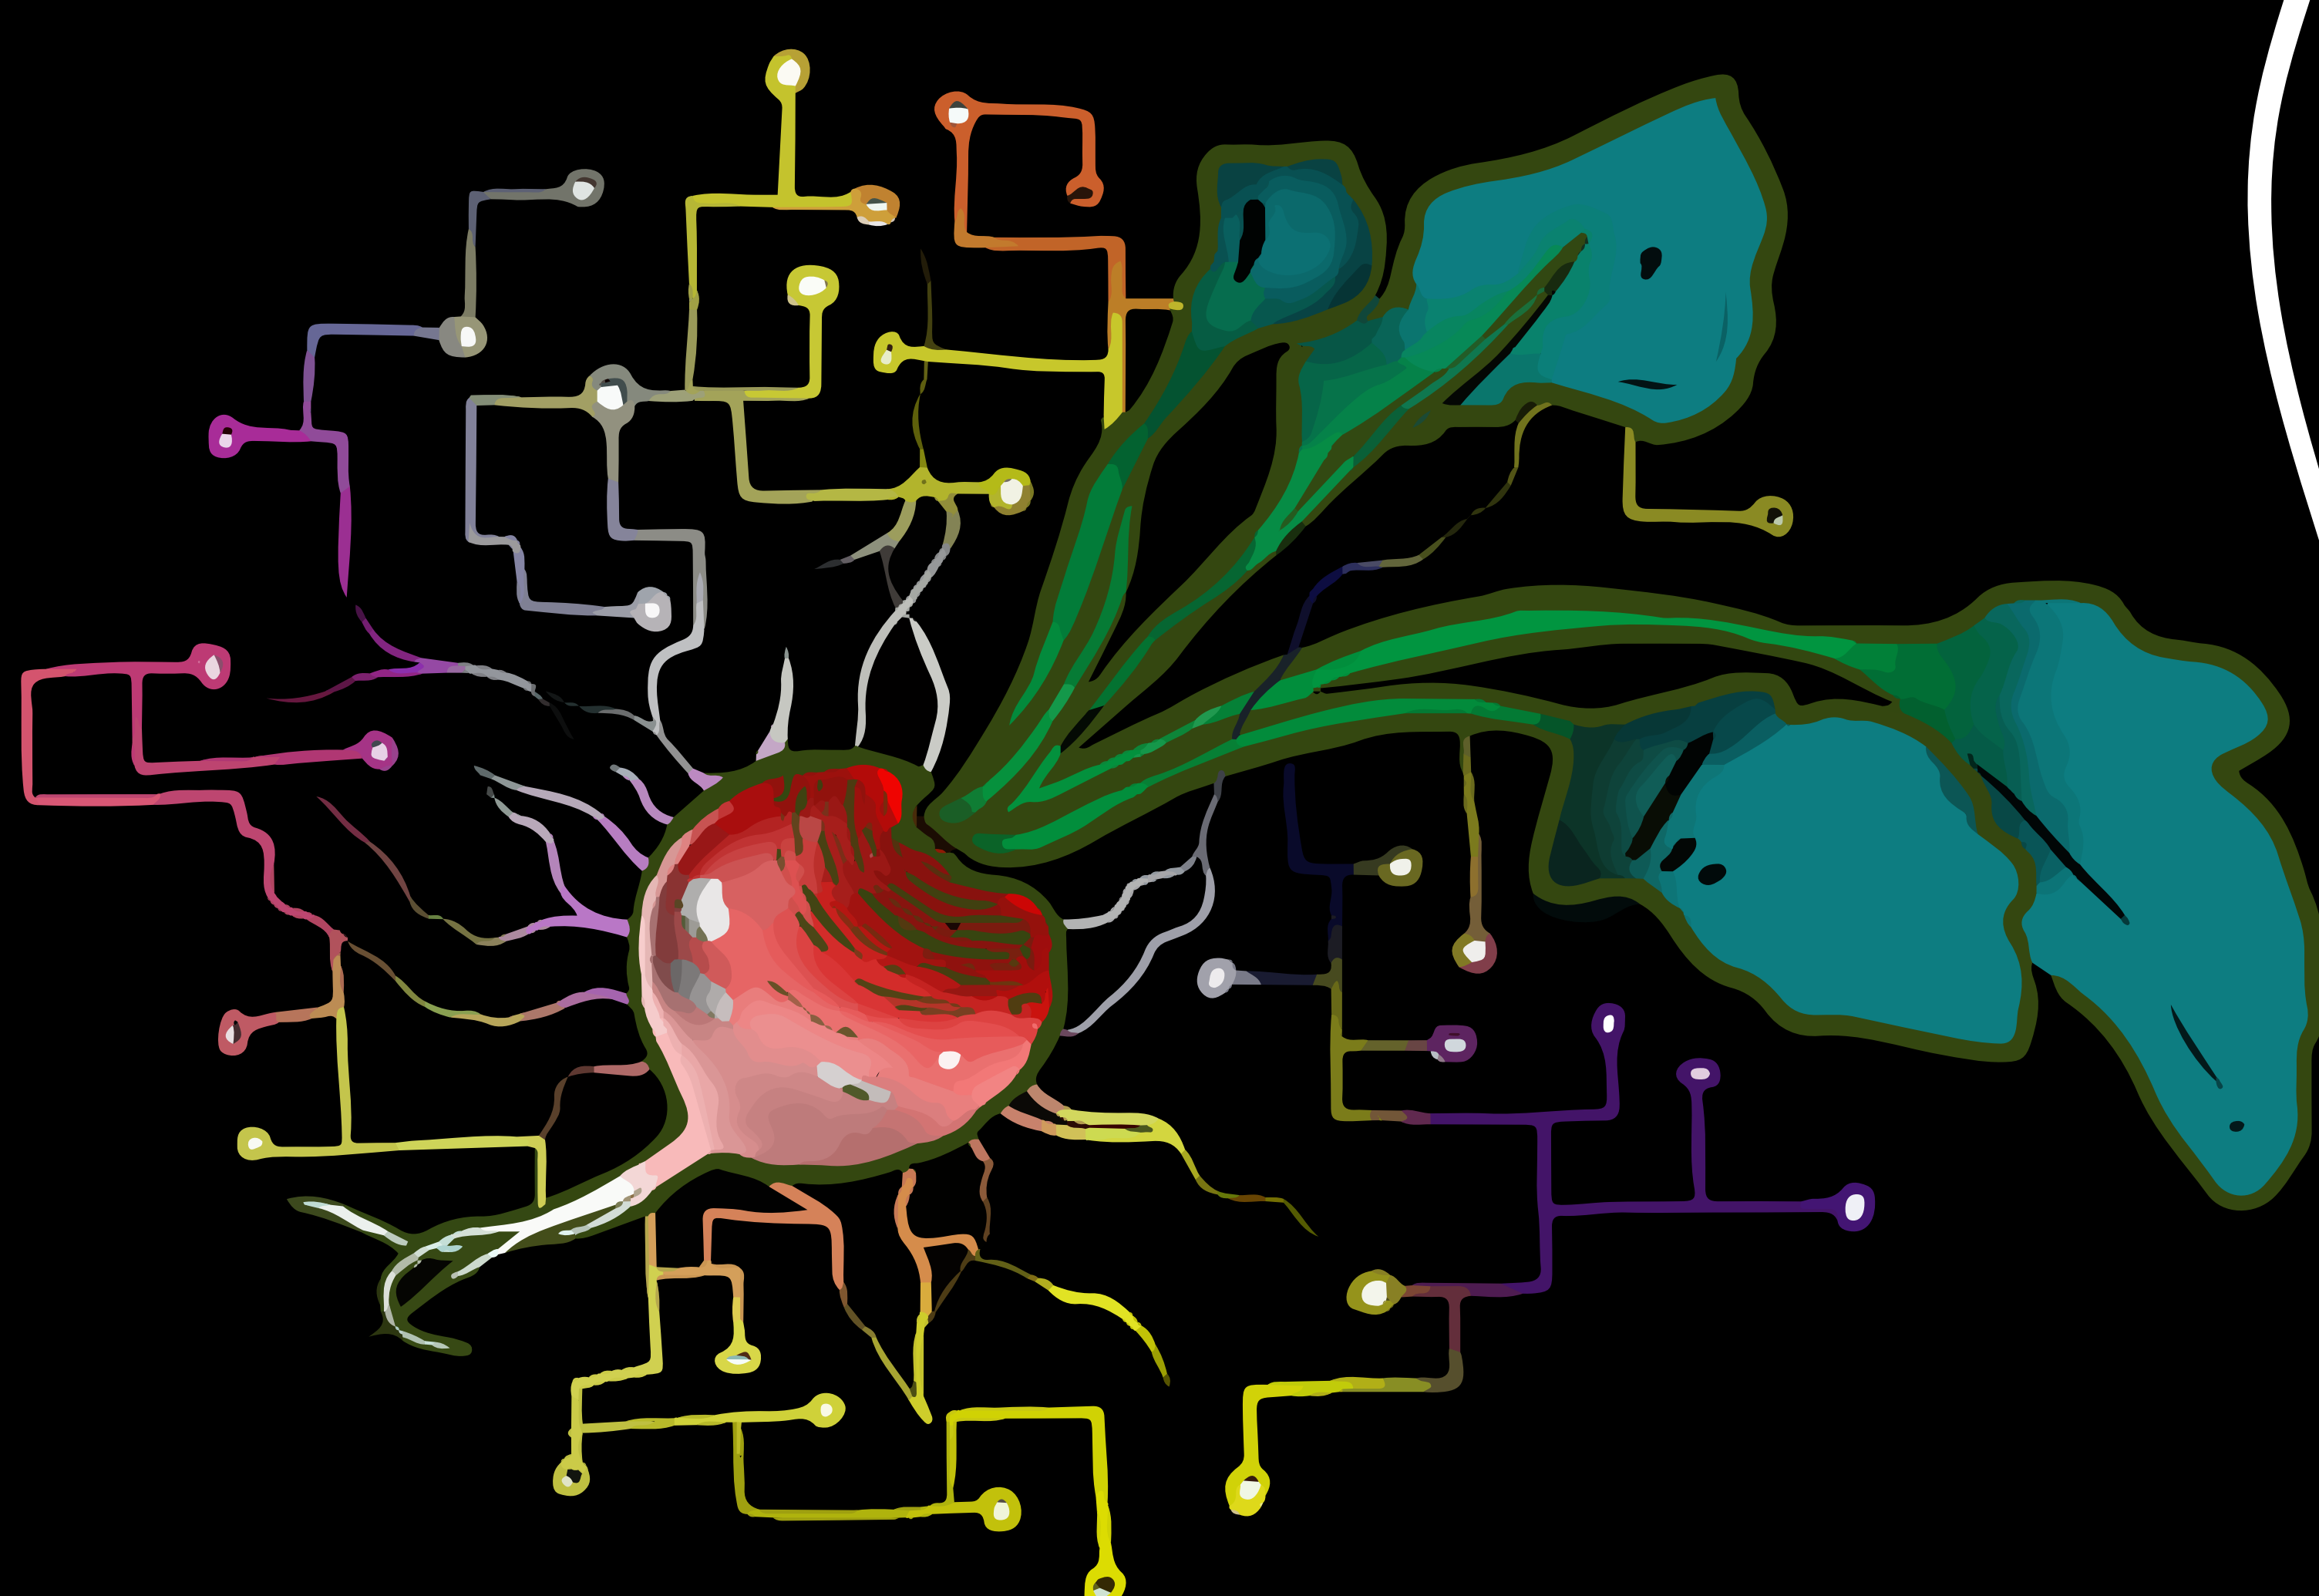

Our goal is to encourage the farm to table movement, simplify the food supply chain for an online generation of customers, and promote rural development through tokenization and acceleration of small agricultural projects.

## About the Project

"The blockchain farmer's market"

A decentralized autonomously run organization, providing immutable smart contracts to help bring small supplier and small buyer together in an open marketplace with no middle-men.

A tokenized and staking protocol provides liquidity for people who are interested in developing agricultural projects, or generating a passive income.

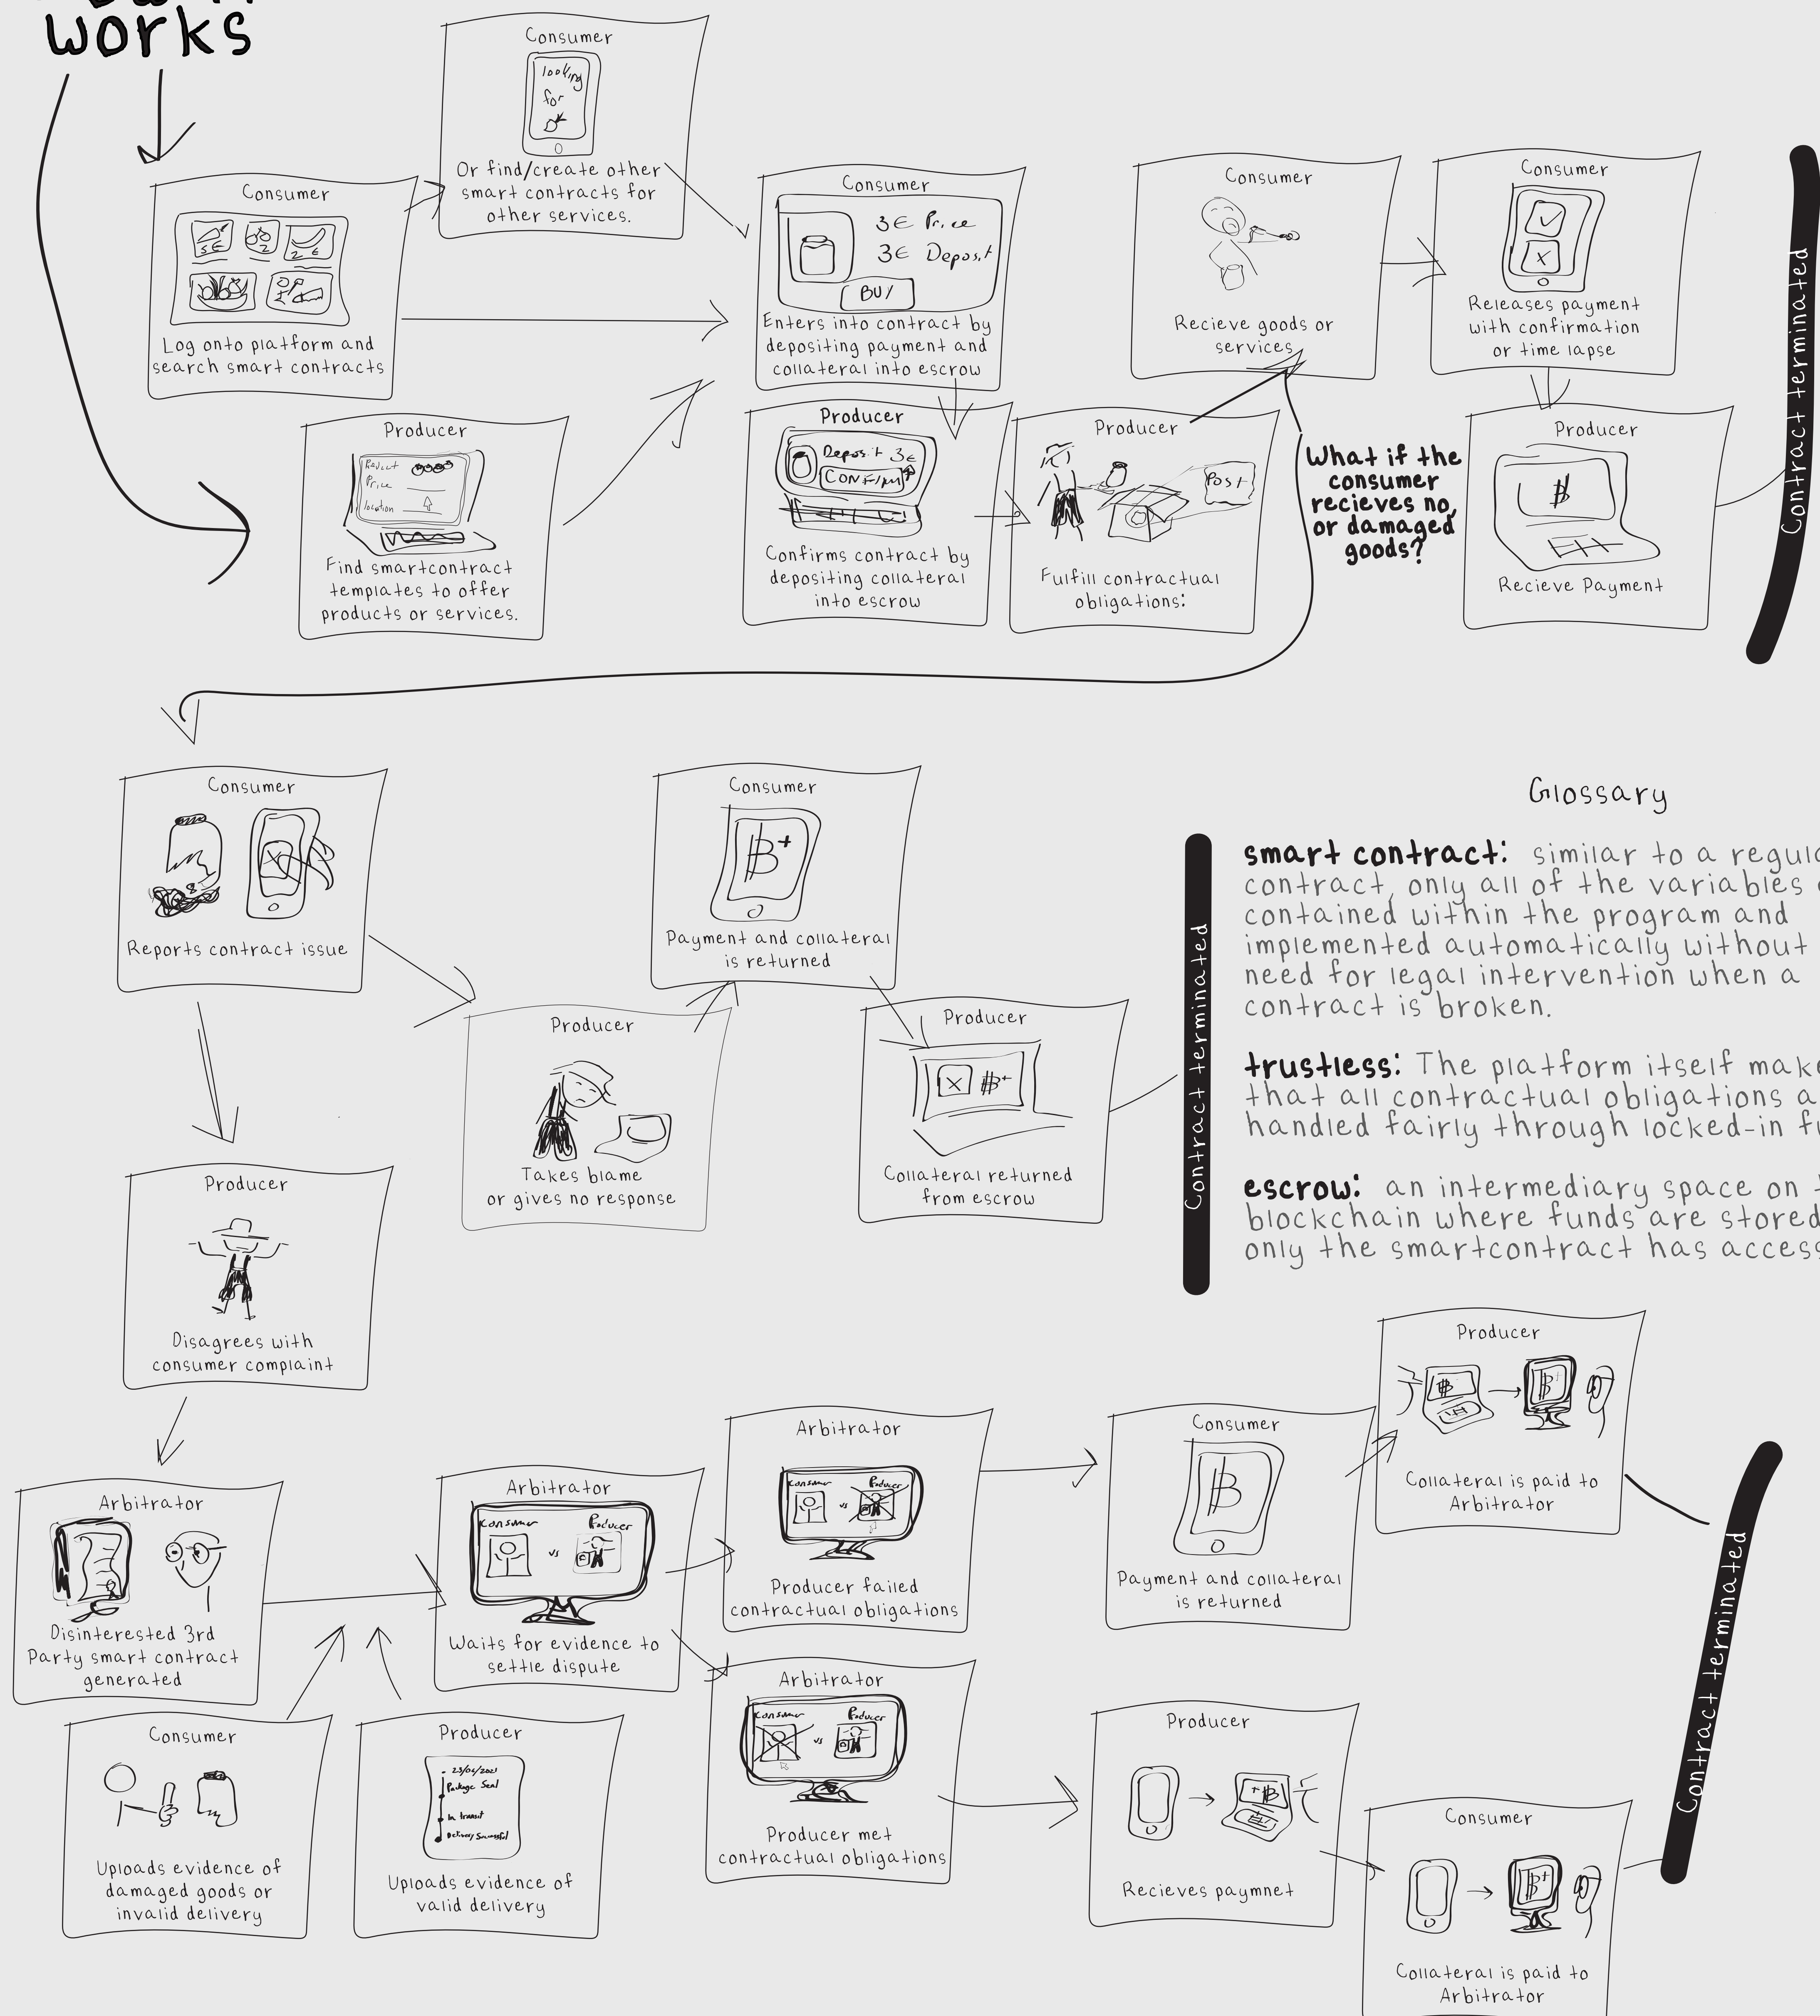

## Issue

People want to buy and people want to sell. The commercial food supply chain has become overcomplicated. Many small farmers, whether microgreen growers or vegetable hobbyists need to compete with large suppliers, meanwhile consumers are growing increasingly more aware of where their food comes from and want to find local producers in their area. Incentivising the maximum use of space through a

## Solution

Simplify the food supply chain by offering decentralized solutions. Create a platform where producers and consumers can easily generate immutable smart contracts between themselves in a trustless way. Escrowed deposits from both parties of the contract deter malicious intent. Users who wish to stake tokens into the protocol, or pay with the protocol's native token receive rewards and discounts. Staked tokens and funds provide liquidity for small agricultural projects to accelerate decentralized growth spanning a variety of localities

## How it works

## Glossary

**smart contract:** similar to a regular contract, only all of the variables are contained within the program and implemented automatically without the need for legal intervention when a contract is broken.

**trustless:** The platform itself makes sure that all contractual obligations are handled fairly through locked-in funds.

**escrow:** an intermediary space on the blockchain where funds are stored and only the smartcontract has access to.

## Road Map

2022/Q3  
#dAGRO ICO

Initial Coin Offering will commence around a tokenomic platform with incentives and rewards.

2023/Q3

"Edible NFTs" and Tracing

The tokenization of foodstuffs will increase their reliability and traceability.

2024

Growers Rewards

Independent users can gain rewards through the growing, weighing and validating of their own food production through combined software and IoT hardware.

2022/Q1

dApp Launch on Cardano

Templates for P2P smart contracts and a UI will significantly increase user access and enable producers and consumers to easily draw up immutable decentralized smart contracts for free and fair economic exchange.

2023/Q1

Small Farm Funding

Staking for passive income will become an integral part of decentralized agro project catalyst funding, and a community voting system will be put in place for the allocation of treasury grants and loans.

## And Beyond...

"Cryptourism"

Working with networks of local vendors, Amici Elettronici's goals are to create discount incentives for the usage of #dAgro and other currencies throughout Italy, contributing to a new kind of "cryptourism" industry that celebrates Italian cuisine, and offers growers from other areas to literally "taste" their staking rewards.
